1.InventoryTrend

In the last 2 month inventory quantity and percentage experienced drop, with the worst drop happen on **April 2023 with 50%+ across all categories**, This reversal is highly uncharacteristic, as it follows a sustained period of steady positive growth

2. Overall Categories

All product categories experienced the same condition , with all segments experiencing a drop of over 50%, confirms that the issue is not limited to category-specific stocking strategies; rather, it indicates a systemic operational failure

Insight Derivation

Company Context (with BCG Matrix)

1. Optimization Impact & Inventory Crisis

Potentially the Look management team trying to optimize the budget in order to reinvest the budget to something else, potentially for the “**star**” (high shares-high growth) in this case they might cut **stock acquisition cost**, resulting on steep decline on inventory quantity, this decline either foreseen or not are proven to be detrimental as at that rate, the company is at risk to **losing sales due to out-of-stock**

2. Systematic Resource Allocation

The strategy to **liquidate the pets** (low-growth and low-shares categories) has backfired. Instead of targeting specific areas, the reduction has caused a **universal decline** across all product categories. This indicates a failure in how the optimization was implemented.

Customer Behaviour

Retention Rate on TheLook eCommerce is so low with only 3-8 % user completed transaction after the following month of their first purchase, this might possibly happen because low customer satisfaction (product, system , etc)

Customer Base

With around 90-95% Customer Churn Rate after initial purchase TheLook customerbase health is severely at risk, because this indicate most of its customer are bargain/promo hunter

Compare Groups

Over the time the TheLook Retention Rate steadily growing especially from the newest batch of customer, might indicating company awarress and willingness to adress and fix this matter

Acquisition Cost

Big Customer Churn Rate will also hinder the Customer Acquisition Cost Efficiency, indicating TheLook campaign model is unsustainable and need to be revised

Reacceleration

Several months with higher customer than previous month, might indicate shift on customer trend, or seasonal. Further analysis are required.

Insight Derivation

Company Context (with BCG Matrix)

Shift in company policy

The rising retention and acquisition numbers suggest that management has redirected its efforts toward **customer experience and loyalty**. However, this shift likely came at the **cost of the Inbound and Inventory budget**. While the customer side is thriving, the supply side is struggling to keep up, creating a gap between high demand and low stock.

Star Categories Prioritization

By **liquidating "Pets" and reinvesting in "Stars,"** the company has significantly improved the quality of its product selection. Providing a more curated and **high-performing catalog** that potentially increases customer satisfaction. This improved experience makes customers more likely to return, driving a steady increase in the Retention Rate.
